Subject: Metadata for the FL shape files +

Hi Mitch:

Attached is a README file generated by Metamaker you can throw in with the accession;
re Don's suggestion for future generations I used an old version of dBase IV to make two
blank delimited ASCII files - (Artreef_NODCver.txt and Reefs_NODCver.txt) - the third ORIGINAL .dbf file (shore.dbf) was generated from within Arcview as someone drew the shore (Arcview makes it's own .dbf attribute tables) and therefore exporting it is worthless - it's just the number of nodes in the line. I added column descriptions to the txt files for future archivists.

Anyway, please let me know when you give these files an accession number and you might want to add the number to the README file and I will change the record in Metamaker on my end.

Thanks! Sheri P. (:

Artreef NODCver.txt

Artreefs README.txt

Reefs NODCver.txt
