

Gordon Gunter Cruises 1 – 9  
Calibration Data for EK60, ADCP, and CTD Instrumentation  
Read Me

Over the course of DWH Cruises 1-9, the ship technicians aboard the NOAA Ship Gordon Gunter occasionally ran tests with various instruments while the ship was in port, including CTDs, the hull-mounted ADCP, and the EK60 echo sounder. These data from days in port were preserved, but have been placed in the Calibration directory for each instrument to distinguish them from data collected at sea.

Within each Calibration directory, these test data are located within subfolders named by the date the test data was collected. In all cases, these are dates that the Gunter is confirmed to have been in port between cruises, based on NOAA Shiptracker position history and correspondence with ship technicians and scientists.
